

## **Introduction/Business Problem**

Often when a student shifts to a new city, he/she searches for a hostel/room to stay and generally ends with lots of choices or no choice at all. This project is focused on easing the problem of finding a right place (Probable area in the city) to stay for the student.

## **Data**

Data used in this project will be taken from FourSquare.com API. The data will consists of information about the city (For instance, Indore (M.P) , India ).

I will try to gather the information of the locations located around the student college and then will try to suggest the best area/location the student can stay using ML techniques.
